Chapter 4
Uponor Distribution Components

This section outlines the manifold sets available for use with radiant floor heating and cooling systems in residential and commercial applications.
Uponor Engineered Plastic (EP) Manifold

The Uponor Engineered Plastic (EP) Heating Manifold is constructed of thermoplastic, high-performance, advanced materials suitable for use under conditions of high impact, heat and moisture. They are a lightweight, economically priced and a sustainable choice for both residential and commercial radiant applications.

The EP Heating Manifold is rated with the following capabilities:

- 140°F at 87 psi
- 158°F at 72 psi
- 176°F at 58 psi
- 194°F at 43 psi

The manifold comes with a mounting bracket for fast and easy installation on a wall. Simply snap the manifold into the mounting bracket, and installation is complete.

The EP Heating Manifold is available in two through eight loops, and it accommodates 15.4 gallons per minute (gpm). Uponor also offers single loops to extend service up to 12 loops total. Refer to page 27 for the exploded EP Heating Manifold view.

Balancing — Balance an EP Heating Manifold with the included visual flow meter.

Applicable Tubing —
EP Heating Manifolds support the following tubing.

- ⅛”, ⅜”, ½” and ¾” Wirbo hePEX™ and Uponor AquaPEX® tubing with ProPEX fitting assemblies
- ½” and ¾” Wirbo hePEX and Uponor AquaPEX tubing with MLC tubing compression fitting assemblies
- ¼”, ⅛”, ⅜”, ⅝” Wirbo hePEX and Uponor AquaPEX tubing with QS-style compression fitting assemblies
TruFLOW™ Manifolds

TruFLOW™ manifolds are made of highly reliable extruded brass and come preassembled for easy installation. The manifold mounts on a durable metal bracket and features a basic end cap on the supply and an end cap with vent and drain on the return. The inlet side of the manifold is equipped with R32 unions to fit any manifold adapter currently offered. The supply manifold body features calibrated balancing valves. The return manifold comes with on/off valves to mount thermal actuators or motorized valve actuators (MVAs). Its high-flow capacity can handle up to 12-loop configurations.

Balancing — TruFLOW manifolds traditionally use balancing valves for ease in situations where loop lengths vary across the manifold body. To balance manifolds that do not have visual flow meters, refer to Performing Initial Flow Balance Calculations on page 73.

The TruFLOW Manifold is also available in a valveless configuration for situations that do not require balancing on the loops. For example, a manifold that has only one zone, equal loop lengths and is configured in a reverse-return orientation would be a great application for the TruFLOW valveless manifold.

The maximum operating temperature and pressure for the TruFLOW manifolds and flow/temperature meters is 220°F at 145 psi. Refer to page 29 for the exploded TruFLOW manifold view.

Applicable Tubing —

TruFLOW manifolds support the following tubing.

- ½” and ¾” Wirsbo hePEX and Uponor AquaPEX tubing with MLC press fitting assemblies
- ¼”, ½” and ¾” Wirsbo hePEX and Uponor AquaPEX tubing with ProPEX fitting assemblies
- ½” and ¾” Wirsbo hePEX and Uponor AquaPEX tubing with MLC compression fitting assemblies
- ½”, ¾”, ½”, ¾” Wirsbo hePEX and Uponor AquaPEX tubing with QS-style compression fitting assemblies

Complete Design Assistance Manual — Chapter 4 — Uponor Distribution Components

uponor
HDPE Valveless Manifolds

The HDPE manifolds are available in 2, 3 and 4-inch dimensions. The manifolds feature 300-series stainless steel ProPEX fitting adapters preformed on the HDPE outlets. The manifold is designed to only support ¾" and 1" PEX tubing. The HDPE manifolds do not offer an oxygen-diffusion barrier. Primary application is for direct burial in systems isolated with a heat exchanger.

Balancing — HDPE manifolds are not designed to balance across the manifold. All loop lengths must be within 3% of each other in length on the manifold.

Example

If the design calls for 267-foot loops on the manifold, then the range of loop lengths must fall within 263 and 271 feet. Three percent of 267 feet is 8 feet — 4 feet on either side of your target length.

Supply and return piping to the manifold should be installed in a reverse-return configuration to allow self-balancing across the manifold.

Applicable Tubing — HDPE manifolds support the following tubing.

- ¾" and 1" Wirsbo hePEX and Uponor AquaPEX tubing with ProPEX fitting assemblies

Copper Valved Manifolds

These 2-inch copper valved manifolds are 48 inches long with 12 valved outlets. The outlets come in several configurations of ProPEX or male threaded connections. The outlets are valved with either a ball valve (isolation) or a ball valve/balancing valve combination (isolation with balancing).

Balancing — Remove the knurled safety cap from the valve. Using an Allen or hex key, turn the memory spindle clockwise until closed. To balance, turn the hex key (counterclockwise) the number of required turns from close. Replace the safety cap.

The longest loop on the manifold will be left full open. From closed to full open is 10 full turns of the memory spindle. Balance the other loops using this formula:

Loop to be balanced/longest loop on the manifold x 10 = number of turns from closed

Example

Loop to be balanced: 250 feet
Longest loop on the manifold: 300 feet

\[ x = \frac{250}{300} \times 10 \]
\[ x = 0.83 \times 10 \]
\[ x = 8.3 \]

The memory spindle for that 250-foot loop would be turned open 8.3 turns from closed.

Applicable Tubing — These copper valved manifolds support the following tubing.

- ¾" and ⅜" Wirsbo hePEX and Uponor AquaPEX tubing with ProPEX or QS-style fitting assemblies
- ¼" and ⅜" MLC tubing with QS-style fitting assemblies
